

Potatoes, Cereals, Emerging Crops, Grain Corn and Oilseeds

Annex 1

Compulsory and recommended standards for cereal, emerging crops, grain corn and oilseed productions

Annex 2

Compulsory and recommended standards for potato productions

Important information

Participant's commitment

All potato, cereal, emerging crops, grain corn and oilseed producers who enrol in the Crop Insurance Program (ASREC) or the Farm Income Stabilization Insurance Program (ASRA)¹ commit to growing their crops according to farming methods that comply with the standards set out in this guide and as stipulated in these programs.

Where La Financière agricole deems it necessary, it can ask participants to present a cultivation plan describing their farming methods. This concerns participants, in particular, who report that they do not abide by the standards found in this guide or who use a specific farming technique.

If any major change in farming methods is planned, whether in relation to the previous year or in the course of the season, participants must notify the advisor at La Financière agricole. The advisor can then assess any potential impact the change could have on the insurance coverage.

Cross compliance measures

Along with the farming methods in this guide, the methods related to the cross compliance measures stipulated in the ASREC and ASRA programs can also be found. There is also a rule related to the phosphorus report for the Agri-Québec program, the financing programs and the financial support program for aspiring farmers.

These measures concern the annual submission of a balanced phosphorus report to the Ministère de l'Environnement et de la Lutte contre les changements climatiques, the respect of shorelines (riparian buffers) and the ban on planting crops on certain areas in the municipalities listed in the Agricultural Operations Regulation (AOR).

Sustainable agriculture and organic farming

La Financière agricole du Québec encourages innovative methods focused on sustainable agriculture, including organic farming. The methods approved and recognized by the Centre de référence en agriculture et agroalimentaire du Québec (CRAAQ) along with the most appropriate intervention strategies and the recommendations issued by the Réseau d'avertissements phytosanitaires (RAP) are therefore complementary to the farming methods found in this guide. Note that FADQ encourages you to sign up to receive memos issued by RAP on the website of the Ministère de l'Agriculture, des Pêcheries et de l'Alimentation (MAPAQ).

Concerning organic production methods, participants who opt to benefit from specific coverages offered must be certified by one of the certification agencies recognized in Québec by the Conseil des appellations réservées et des termes valorisants (CARTV).

¹ Offered only to cereal (excluding rye) and canola producers

Farming standards

Participants in the Crop Insurance and Stabilization Insurance Programs must abide by the compulsory and recommended standards described in this guide; Annex 1 for cereal, emerging crops, grain corn and oilseed crops and Annex 2 for potatoes. The information in this guide will help you make decisions based on the requirements of your respective insurance coverages.

Compulsory standards

The standards concerning seed type and seeding dates provide the essential conditions for successful crop production. They make it possible to grow quality products, in the quantities specified in the farm type referred to by La Financière agricole.

Where these standards are not met, participants must notify the advisor of La Financière agricole as soon as they realize it and, at the latest, when reporting seeded areas.

Under crop insurance, any areas that are cultivated using farming methods that depart from the compulsory standards will not be insured. If this situation is not reported when the declaration of seeded areas is made, the crop insurance contribution will not be reimbursed.

Under stabilization insurance, any insurable areas that are cultivated using farming methods that depart from the compulsory standards will be reduced from the total insured area by taking into account the impact of these methods on the yield. Participants must pay, as an administrative fee, an amount equal to the share of the stabilization insurance contribution that would otherwise have been due on all the insured areas.

Recommended standards

Where farming standards differ from those listed in the annex, participants must notify the advisor of La Financière agricole as soon as they realize it, before damage occurs and, at the latest, when reporting seeded areas.

For sustainable agriculture and organic farming, La Financière agricole supports the methods recognized by CRAAQ along with the most appropriate intervention strategies and the recommendations issued by the Réseau d'avertissements phytosanitaires (RAP) that are added or complementary to the best practices described for each of the products in the annex.

Under crop insurance, based on the information provided by participants regarding their farming methods, the certificate could be modified by adjusting the probable yields or withdrawing the areas concerned. If nonconforming methods are not reported, the areas concerned will be assigned the average actual yield of fields that do conform. In the absence of any data on fields that conform, the yield assigned to the nonconforming areas will be established based on the participant's probable yield and the percentage of the zone's loss where these areas are located.

Under stabilization insurance, for the recommended standards, the rules related to any insurable areas that are cultivated using farming methods that depart from the standards are the rules described in the compulsory standards for the same insurance product.

1. COMPULSORY STANDARDS

Farming methods	Compulsory standards
A. Seed types	<p>Cereal, emerging crops, grain corn and oilseed (canola and soybean) seed must, as stipulated in the Seeds Regulations,:</p> <ul style="list-style-type: none"> • Be recognized as <i>Canada pedigreed</i> status (<i>Breeder, Select, Foundation, Registered or Certified</i>); • Have a germination rate of 75% or greater that has been officially verified in the 12 months prior to seeding. <p>Cereal, emerging crops, and oilseed seed varieties used must have been subject to a registration valid for Québec, as stipulated in the Seeds Act.</p> <p>Organic farming</p> <p>To meet the production standards of certification agencies and the application framework of the farming standards approved by La Financière agricole, producers must use <i>Canada pedigreed grade</i> “organic-certified” seed. If it is impossible for producers to meet this requirement, an equivalent recognized by La Financière agricole based on market availability may be accepted. In this event, the participant must contact the advisor at La Financière agricole.</p>
B. Seeding deadlines	Seeding must be completed no later than the dates indicated in the Seeding deadline table.

Seeding deadlines¹

Crops	Sectors / Zones	Dates
Grain corn	All	June 1
Wheat	Service centres of Alma, Amos, Caplan, Lévis, Rimouski and Rivière-du-Loup	June 5
	Other service centres	June 1
Oats and barley	All	June 15
Canola	Zones of under 2600 corn heat units (CHUs)	June 10
	Zones of 2600 CHUs or over	June 1
Soybeans	Zones of under 2600 CHUs	June 10
	Zones of 2600CHUs or over	June 15
Hemp, grown for the seeds, Spring Rye	All	June 15
Flax, grown for the seeds, Dry broadbeans, Fava beans	All	June 1

¹ La Financière agricole may however change these dates if seeding cannot be completed due to a covered risk.

Corn varieties must be selected on the basis of seeding deadlines, as stipulated in Item 3 of this guide: Selection of grain corn varieties.

2. RECOMMENDED STANDARDS

Farming methods	Recommended standards
A. Planning	The number of hectares to seed is planned based on the ability to get all the work, from seeding to harvesting, done on time.
B. Drainage	Proper soil drainage makes it possible for seeding and harvesting to be done in ideal conditions at the best times of year. It also ensures that crops grow normally.
C. Tilling	Tilling techniques are those recommended by the Centre de référence en agriculture et agroalimentaire du Québec (CRAAQ) in the <i>Guide des pratiques de conservation en grandes cultures</i> . Any areas cleared or readied for seeding, subject to AOR provisions, were prepared more than one year ago and are conducive to growing grain.
D. Fertilization	<ul style="list-style-type: none"> - Soil analysis results and the presence of previous crops, green manure, organic mulch and manure are considered when calculating the number of fertilizing units to use. - The number of fertilizing units (organic and mineral fertilizer) and the application method comply with the tables published by CRAAQ or with the Plan agroenvironnemental de fertilisation (PAEF) (agroenvironmental fertilizer plan), as the case may be.
E. pH _{water}	The proper pH _{water} range is indicated in the table below.

Proper pH_{water} range²

Crops	Sandy soil	Other soil
Oats	5.8 to 7.0 ³	5.6 to 7.0 ²
Wheat	6.0 to 7.0	6.0 to 7.0
Barley	6.0 to 7.0	6.0 to 7.0
Grain corn	6.0 to 7.0	5.8 to 7.0
Canola	6.0 to 7.0	6.0 to 7.0
Soybeans	6.2 to 7.0	6.2 to 7.0

² Certain soil series may naturally have a pH that is higher than those indicated while still being very productive (CRAAQ, 2010).

³ A pH of 5.2 is accepted for oats only when rotated with potato varieties susceptible to common scab.

Farming methods	Recommended standards
F. Weed control	All steps are taken to ensure proper weed control using registered pesticides, mechanical processes and crop rotation.
G. Disease and pest control	<ul style="list-style-type: none"> • The recommendations of the Réseau d'avertissements phytosanitaires (RAP) and those of CRAAQ, including for crop rotation, are applied for disease and pest control. • When a cultivated area was affected by fusariose the previous year, one of the following three methods is applied: ploughing, rotation with a plant other than graminea or the use of cultivars evaluated by the Réseau Grandes cultures du Québec (RGCCQ) with a fusariose resistance rating of from 1 to 5 inclusively for barley and of 1 or 2 for wheat. • In the presence of clubroot, rotation every 4 years is accepted if resistant varieties of canola are used and best practices are applied. • La Financière agricole compensates farm producers for eventual non-recurring loss due to seed pests on areas insured under the ASREC program, even if the seeds were not coated with insecticide.
H. Seeds	<ul style="list-style-type: none"> • Soil temperature has reached at least 10°C for grain corn and for soybeans. • The seed dosage recommended for the specific cultivar or hybrid is respected. The dosage depends, among other things, on the target population, the space between rows, the size of the grain and the seed germination rate. • Soybean seed is properly inoculated using inoculants specific to soybeans. Inoculation is an important operation that has a direct effect on nitrogen fixation.
I. Selection of cultivars, Cereals	Cereal cultivars are selected on the basis of the number of possible growing days in the municipality where they are seeded.
Grain corn	Grain corn hybrids are selected on the basis of the number of CHUs available in the municipality where they are seeded, as established by the new Agroclimatic Atlas of Québec. The CHU value for hybrids also takes into account the date on which seeding occurs. For hybrid selection, see Item 3 below.
Soybeans	Soybean cultivars are selected on the basis of the number of possible growing days and the number of CHUs available in the municipality where they are seeded.

3. SELECTION OF GRAIN CORN HYBRIDS

To select an appropriate corn hybrid, consult the *CHU List by Municipality* starting on page 7. Note the CHU limit of the municipality where the corn will be seeded and then refer to the table below. The table will help you select the hybrid based on the time of year seeding will occur.

Table of number of corn heat units according to the zone and seeding deadline

Use this table for planning and where weather delays seeding. The number of CHUs for the hybrids seeded must not exceed the following maximums:

Seeding dead- lines	Zone 2300	Zone 2350	Zone 2400	Zone 2450	Zone 2500	Zone 2550	Zone 2600	Zone 2650	Zone 2700	Zone 2750	Zone 2800	Zone 2850	Zone 2900	Zone 2950	Zone 3000
May 10 and before	2350	2425	2475	2550	2600	2650	2700	2750	2800	2850	2900	2950	3000	3050	3100
May 11 to 15	2350	2425	2475	2550	2600	2625	2675	2725	2775	2800	2850	2875	2925	2975	3000
May 16 to 20	2350	2425	2475	2525	2575	2600	2625	2675	2700	2725	2775	2800	2850	2900	2925
May 21 to 25	2350	2400	2450	2500	2525	2550	2575	2600	2625	2650	2700	2725	2775	2825	2850
May 26 to 28	2300	2350	2375	2425	2450	2475	2500	2525	2550	2575	2600	2625	2675	2725	2750
May 29 to June 1	2275	2300	2325	2375	2400	2425	2450	2475	2500	2525	2550	2575	2625	2675	2700

For seeding in organic soil, select hybrids needing 150 CHUs less because of the risk of early frost. For example, on May 21 in a 2500-CHU zone, seeding in organic soil is limited to hybrids of 2375 CHUs.

When La Financière agricole postpones the seeding deadline for grain corn due to inclement weather conditions, corn hybrids must be selected according to the table below:

Seeding deadlines	Zone 2300	Zone 2350	Zone 2400	Zone 2450	Zone 2500	Zone 2550	Zone 2600	Zone 2650	Zone 2700	Zone 2750	Zone 2800	Zone 2850	Zone 2900	Zone 2950	Zone 3000
June 2 to 5				2300	2325	2350	2375	2400	2425	2450	2475	2500	2550	2600	2625
June 6 to 10									2350	2375	2400	2425	2475	2525	2550

EXAMPLE

I will seed grain corn in Cap-Santé. I want to know what hybrid type is recognized by La Financière agricole. First, I consult the CHU List by Municipality. It tells me that the municipality of Cap-Santé is in a 2400-CHU zone. I use that information in the table below.

Knowing that I will seed between May 29 and June 1, I match the line corresponding to this date with the column of the 2400-CHU zone. The box at the intersection of the line and the column allows me to determine the CHU limit to meet. In this case, the corn hybrid to seed must be 2325 CHUs at most.

Seeding dead- lines	Zone 2300	Zone 2350	Zone 2400	Zone 2450	Zone 2500	Zone 2550	Zone 2600	Zone 2650	Zone 2700	Zone 2750	Zone 2800	Zone 2850	Zone 2900	Zone 2950	Zone 3000

1. COMPULSORY STANDARDS

Farming methods	Compulsory standards
A. Seed types	Seeds used will be of a superior or equal grade to the certified grade.
B. Seeding deadlines	Seeding must be completed no later than the dates indicated in the Seeding deadline table.

Seeding deadlines⁶

La Financière agricole Service Centres	Varieties maturing after 115 days	Varieties maturing in 115 days or less
Alma, Gatineau, Granby, La Prairie, L'Assomption, Lévis (excluding Côte-Nord), Nicolet, Rouyn-Noranda, Saint-Eustache, Saint-Hyacinthe, Saint-Jean-sur-Richelieu, Sainte-Marie, Sherbrooke, Trois-Rivières, Victoriaville	June 10	June 10
Caplan, Rimouski, Rivière-du-Loup (excluding the loams of Kamouraska)	June 10	June 15
Rivière-du-Loup (for the loams of Kamouraska)	June 10	June 20
Lévis (Côte-Nord)	June 20	June 20

2. RECOMMENDED STANDARDS

Farming methods	Recommended standards
A. Planning	The number of hectares to seed is planned based on the ability to get all the work, from seeding to harvesting, done on time.
B. Drainage	Proper soil drainage makes it possible for seeding and harvesting to be done in ideal conditions at the best times of year. It also ensures that crops grow normally.
C. Tillage	Any areas cleared or readied for seeding, subject to AOR provisions, were prepared more than one year ago and are conducive to growing potatoes.
D. Fertilization	<ul style="list-style-type: none"> - Soil analysis results and the presence of previous crops, green manure, organic mulch and manure are considered when calculating the number of fertilizing units to use. - The number of fertilizing units (organic and mineral fertilizer) and the application method comply with the tables published by CRAAQ or with the Plan agroenvironnemental de fertilisation (PAEF) (agroenvironmental fertilizer plan), as the case may be. - Each variety's specific needs are considered as defined in the <i>Profils techniques et agronomiques de cultivars de pommes de terre</i> published by CRAAQ. - Physiological disorders are reduced by using an application of calcium and boron when seeding.

⁶ La Financière agricole may however change these dates if seeding cannot be completed due to a covered risk.

Farming methods	Recommended standards
E. pH_{water}	The proper pH _{water} range is between 5.2 and 6.2. For potato varieties susceptible to common scab, the pH should not exceed 5.5.
F. Weed control	All steps are taken to ensure proper weed control using registered pesticides, mechanical processes and crop rotation.
G. Disease and pest control	<p>The recommendations of the Réseau d'avertissements phytosanitaires (RAP) and those of CRAAQ, including for crop rotation, are applied for disease and pest control.</p> <p>La Financière agricole compensates farm producers for eventual non-recurring loss related to seed pests on areas insured under crop insurance.</p>
H. Seeds	<p>Soil temperature has reached at least 8°C.</p> <p>Where seed can be cut, it is treated, after the cut, with a recommended fungicide.</p> <p>The seed dosage recommended for the variety is respected. The dosage depends, among other things, on the distance between plantations and the space between rows.</p> <p>Areas seeded with untested new varieties with unknown properties are limited to 10% of the total area and a maximum of ten hectares.</p>
I. Top kill	Top kill dosages are adjusted according to foliage ripeness to prevent tubers from being damaged by rapid top kill.
J. Harvesting	Potatoes to be stored are harvested when the air temperature is between 5 and 18°C.
